## Operating and Maintenance

JORDAN

TYPE "A" MACHINES

MODEL Nos. 3-175, 3-200

### IMPORTANT

Every machine is inspected thoroughly before leaving our plant and is shipped in perfect order. In case of foreign shipment the machine is completely built and tested, properly boxed and crated for export, with detail erection and assembly drawings accompanying the shipment. If properly assembled and cared for, it will give many years of satisfactory service. Keep it in good order at all times. Should any defect develop, it should be eliminated as soon as possible. When replacements of worn or broken castings or other parts are necessary, address your orders to the O. F. JORDAN COMPANY, East Chicago, Indiana, U.S.A. specifying plainly the catalog number, quantity required, if right or left hand, and give serial number of car which appears on company name plate. We make immediate shipment on all standard parts.

O. F. JORDAN COMPANY  
East Chicago, Indiana  
U. S. A.

\* \* \* \* \*

INSTRUCTIONS  
for  
OPERATING TYPE A SPREADER-DITCHER

To have the car ready for operation proceed as follows:

IF LOCOMOTIVE IS EQUIPPED WITH SPECIAL AIR LINE, connect the special air hose at the rear end of the car on left side to the air line leading to the main reservoir on the locomotive.

Turn on the special angle cock handle. This will connect the main reservoir to the special air line on the car.

IF LOCOMOTIVE IS NOT EQUIPPED WITH SPECIAL AIR LINE, the regular train line is to be used for supplying compressed air to the tank on the car. Cut out brake reservoir from train line when air for the reservoir is being supplied through train line. Failure to do this will set the car brakes when the air is applied to operating cylinders.

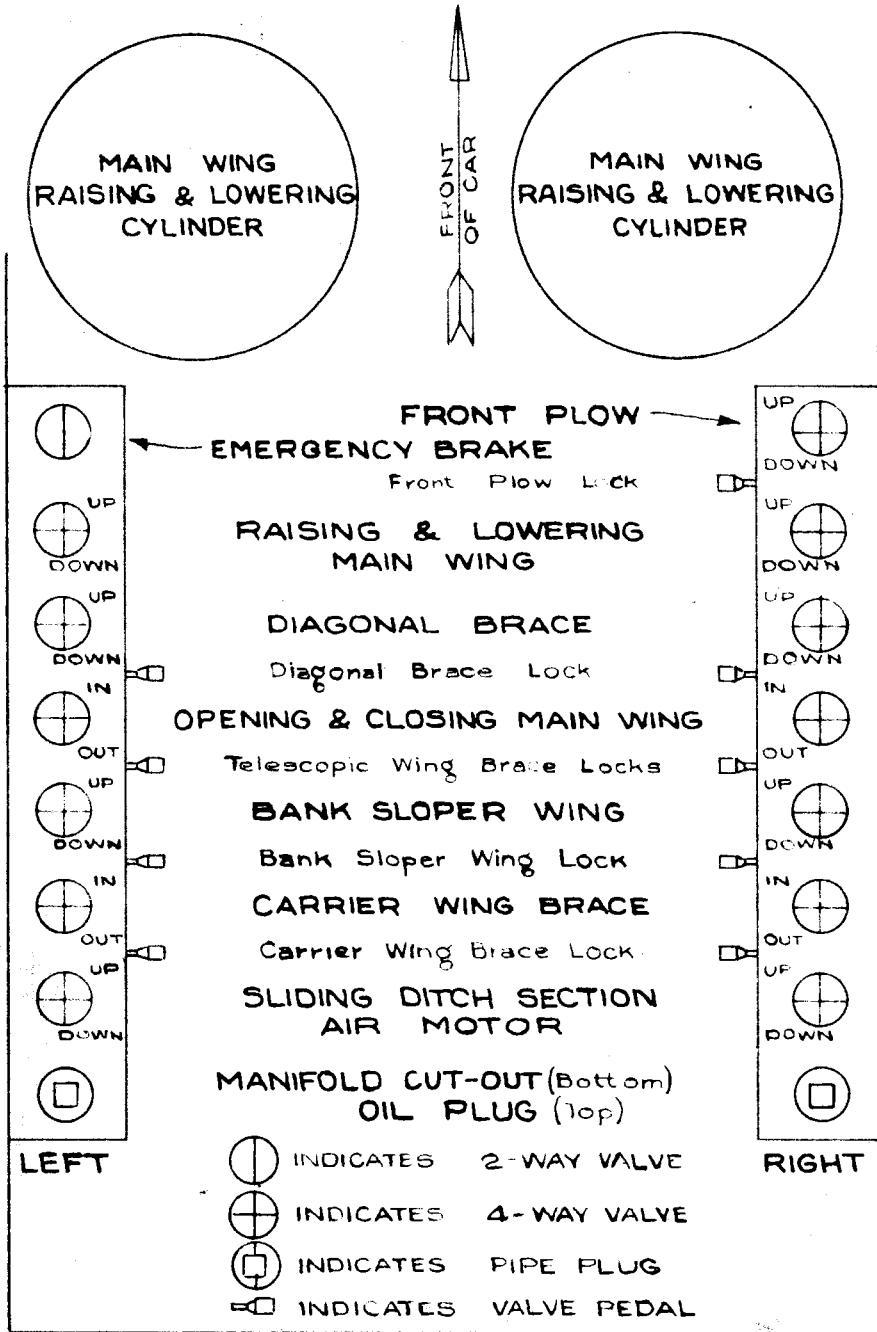

Train line pressure must be raised to at least 90 pounds for successful operation.

In case of either locomotive equipment, turn on the cut-out valve at the horizontal air tank on the car. Now air is being conveyed from the locomotive into the air tank on the car and an air pressure gauge installed in the cab will be found registering the increasing pressure in the tank.

The air tank is constructed for 125 pounds per square inch working pressure, however; in most cases, a lower pressure is sufficient for successful operation. To drain air reservoir, open drain cock at bottom of air reservoir.

OPERATING MANIFOLD

Look over all operating handles in the cab on both sides and see that they are all in neutral position. In other words see that all air cylinders on the machine are cut off from main air line. Turn on the cutout valve located in the cab at the floor, near the rear end of manifolds, this allows the air to come from the main air reservoir, located underneath the cab, to the individual operating valves. This is to be done on the side which is intended to be worked or on both sides, if both sides are to be ready for operation.

On each side in the cab and within easy reach, there are installed valves controlling various features of the machine as shown on the accompanying diagram.

Whenever necessary make use of signal cord suspended under the ceiling of the cab and attached to the whistle on outside of the cab.

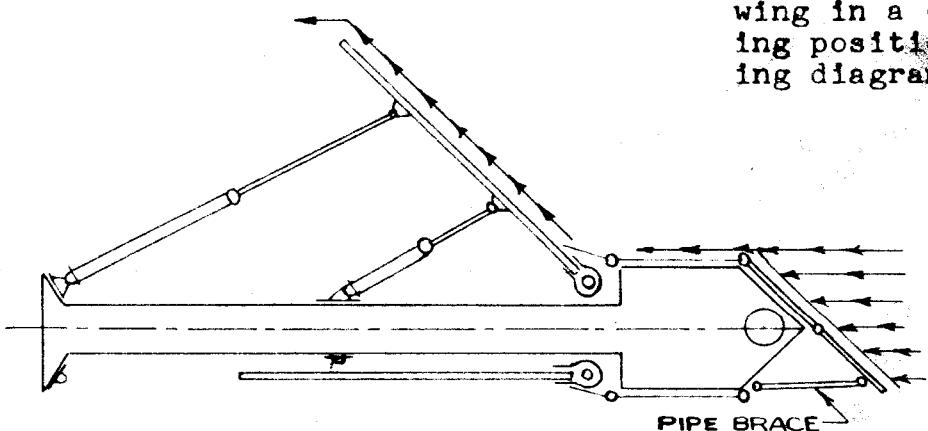

A conductor's valve for applying the train brakes is also placed at convenient point on the left manifold.

When the machine has arrived at the place where it is to work and the train is brought to a stop, the following should be done:

#### PLOW

Adjust plow cutting shoes which are to slide over the rail to the depth required. To do this remove two wedges at the outer end of front plow, open the wing and adjust 2 bolts holding each rail shoe, using plates of suitable thickness.

To spread material from one side of the track to the other, open plow wings and insert the pipe braces in position to hold the wing in a continuous cutting position. (See following diagram.)

When the left plow wing is to be used, and before opening it, the air hose and vertical pipe must be taken out of the way either by swinging it upwards or by disconnecting it at the first union. Remove 2 safety bolts at the rear end of the plow side wings, i.e. disconnecting the plow side wings from the main wings. Now the machine is ready to apply air to the plow cylinder which can be done from right hand manifold in the cab. Turn the handle in direction indicated "Up". This will raise the plow and release the weight of it from the two safety pins supporting the crossbar.

Remove the two pins and insert them in corresponding holes that will permit the plow to lower until the rail sliding shoes are about to touch the rail.

Release the two safety chains at the back of the plow side wings and adjust them to the depth required.

TO LOWER THE PLOW, press foot on plow valve pedal to withdraw stop or lock pin, locking the cross bar, and turn the valve handle at indication "Front Plow" slowly to the direction indicating "Down". The plow may be lowered to any desired depth.

TO RAISE THE PLOW, press the valve pedal, turn the plow valve handle to the direction indicating "Up" and when the plow has reached the highest position, release the foot valve pedal, then lower plow slowly by releasing the air from plow cylinder until full weight rests on pin and turn valve to neutral position.

Care should be taken to see that the stop or lock pin is fully inserted under the crossbar. Use safety pins when car is in transit or plow is not operated.

#### TO OPEN AND CLOSE WINGS

#### GEAR RACK TELESCOPIC BRACES

Braces are locked at all times when foot pedal valve is released. Therefore, to move and adjust wings to working position, first step on foot valve pedal to release locks on "Gear Rack Telescopic Braces". Keep foot on pedal until wing is in desired working position.

#### DIAGONAL BRACE

With one foot on the wing lock pedal valve and the other foot pressed down on valve pedal to release lock block on diagonal brace, then turn diagonal brace valve handle in the direction "Up". When the wing is raised above its safety rest on the side of the car, then move opening and closing valve handles in the direction "Out". This will open the wing at any desired spread.

At the same time the telescopic wing braces will be unlocked and pulled out. Release diagonal brace valve and when diagonal brace is lowered to proper operating position, remove foot from foot pedal valve on diagonal brace which will lock diagonal brace in that position.

## OPENING AND CLOSING WINGS

As mentioned in preceding explanation, first step on wing brace foot lock pedal, then turn the folding cylinder valve in the direction of "Out". This will open wing.

Important when wing is opened, reverse wing folding cylinder valve slightly to release the pressure in the folding cylinder. Avoid any attempt to raise or lower wings they are being opened or closed.

To close wings, the above operation is reversed. Also before attempting to close wings care must be taken to see that they are raised to their full height on the main post, diagonal brace and bank sloper wing. Failure to do this may cause damage to the wing braces. Also see that gear lock blocks on wing braces are released before attempting to open or close main wings.

## RAISE AND LOWER MAIN WINGS

Turn the valve handle operating the main cylinders in direction "Up". This will permit releasing of the two pins supporting the main wings at the main posts. Withdraw the pins and insert one of them in a hole below to correspond with the depth of spread desired. Use of both pins is necessary when the car is in transit.

To lower the main wing turn the valve handle in opposite direction slowly until the wing reaches working depth. To raise the wings reverse the operation.

## DITCHING ATTACHMENTS

Ditching machines are constructed identically with the straight Spreaders. They have all above mentioned features and in addition are equipped with the following attachments:

Bank Sloper  
Air Operated Carrier Wing Brace  
Adjustable Ballast Section  
Mechanically Operated Ditch section

## BANK SLOPER

The bank sloper is connected to the main wing and can be lowered or raised by means of an air cylinder, located on the main wing. It can be locked in any position by means of a pneumatic lock pin. To raise the bank sloper, press foot down on bank sloper valve pedal to withdraw bank sloper lock pin and turn the valve handle marked "Bank Sloper" in the direction "Up". As soon as weight is taken by piston the lock pin will be forced out and the bank sloper can be raised or lowered to any desired position. To lock the bank sloper in any position, release the valve pedal and the lock pin will be forced into a hole in bank sloper.

To operate bank sloper wing up and down without too much wing distortion, place bank sloper wing in half way position before wing braces are locked.

## BANK SLOPES IN CARRY WING FORM

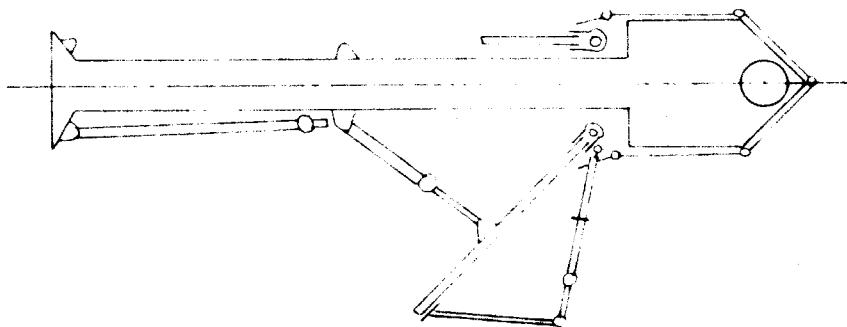

The same wing can be used for carrying material from cuts. To change to the carry wing or bank slope wing to drag form, when main wing is in closed position, disconnect rear brace from bank slope and chain rear brace to bank slope rest on car body. Open main wings in usual manner, lower slope wing to level position and lock with pneumatic pin.

Disconnect bank slope cylinder connecting rod at bank slope wings and pull the connecting unit up on the template wing. Remove 1-1/2" bolt extending through the hinge and bank slope wing, swing bank slope or carrier wing around parallel with the car. Remove air operated carry wing brace from its rest by means of block and tackle furnished with machine. When this brace is lowered and in line with carry wing which has been swung around parallel to the car, step on foot valve marked "Carry Wing Brace", move carry wing brace valve around in direction of "Out" and connect the extended position of air operated carry wing brace to bank slope wing.

The carrier wing hook which extends through the main template wing will catch the wing and hold it in place, when wings are folded to side of car.

To open wings, first release the carrier wing hook and continue as described under "Opening and Closing Wings".

The following sketch illustrates how the wings will look when opened in carrier wing form:

To convert the machine back in spreading and ditching form reverse operation.

### IMPORTANT

Do not ship machine in carrier wing form.

### ADJUSTABLE BALLAST SECTION

Adjustable ballast section is being used principally in skeletonizing track and in any other spreading. Adjustable ballast section is pivoted at the toe of the ballast shoulder and can be adjusted to various depths by means of bolts.

MECHANICALLY OPERATED DITCH SECTION

TO LOWER THE BOX DITCH SECTION, turn the valve handle at indication "Ditch Section" from its neutral position to the direction indicating "Down". The air motor located on the back of the wing will actuate the screw drive and ditch section will gradually descend to any desired depth.

TO STOP THE AIR MOTOR, turn the valve handle back to neutral position.

TO RAISE THE DITCH SECTION, turn the valve handle to the direction indicating "Up". The motor will turn in the opposite direction and raise the ditch section to any intermediate position or up to its maximum, thus transferring the ditcher wing into a straight spreader wing.

GENERAL INSTRUCTIONS

All drains in air lines and reservoir must be opened occasionally to allow accumulated water to drain off. Particular care of this should be taken when machine is being used in cold weather.

The moving parts of the Type A machine are heavy and must be operated slowly at all times to prevent damage to the machine and to the track in case of derailments or otherwise.

Do not do too much spreading or ditching at one movement, especially when in heavy material. The machine will last longer and do better work if not overloaded.

When it is necessary to work around wings, braces or front plow, in the open or down position, first place them in the desired position. Then either allow wings to go down until they rest on the ground or else block them securely so that there is no possible chance for them to drop or swing in. Never allow air in any cylinder supporting a part that will move while working about machine.

When machine is travelling over road, even for short distances, the pins supporting the main wings and the front plow must be in holes, and safety chains at the rear of plow side wings must be pulled tight to prevent the above parts from dropping.

Main wings must rest securely in hooks or wing rests located on side of car and diagonal brace must be locked by the pneumatic pin.

O. F. JORDAN COMPANY  
East Chicago, Indiana  
U.S.A.

LUBRICATION INSTRUCTIONS  
FOR  
JORDAN SPREADERS-DITCHERS-SNOW PLOWS

Always be sure the gear racks of the main wing telescopic braces are kept absolutely free of oil or grease. Clean periodically of accumulated dirt. Keep air lock cylinder packing glands snug to prevent oil or grease dropping onto the gear racks.

Oil, grease, or dirt on the gear racks will result in the braces slipping, causing serious damage to the wing.

At the start of each day's work remove plugs at the rear end of the manifolds. Pour about 1 pint of a good grade of engine lubricating oil and replace plug, and turn air into manifold. Move each valve handle back and forth. This will blow oil into each operating cylinder.

In temperatures above freezing a #20 or #30 S.A.E. grade oil is satisfactory.

The following parts should be lubricated with a heavy cup grease preferably heated to a liquid state, and poured or brushed on.

Stationary post channel guides of the Standard and Road-Master Type Models.

Stationary post column of the Type A Models, using lubricating plug on Sliding Post Assembly.

Plow Slides and Guide Castings of Standard Type Models with High Snow Plow Attachment.

Cables and Sheaves of Front Plow, preferably brushed on the cables. Bank Sloper Wing Operating Cables and Sheaves if a Standard or Road-Master Model.

Hinge Pins connecting Main Wing Hinge to Slide Post Hinge Butt on Standard and Road-Master Models.

Coupler Cover plate guide bars on Standard Model with High Snow Plow Attachment.

Grease Cups on Sliding Ditch Section of Type A Models equipped with Air Motor.

Inside all Gear Rack Brace Pinion Gears and inside large pipe of Main Wing Braces. These points are well lubricated at time of construction and little maintenance is required.

ROLLERS ON SLIDE POST OF STANDARD AND ROAD-MASTER MODELS. Lubricate as required when the JORDAN is in use, with a good grade of engine oil.

All piston rods of operating cylinders.

Universal Joints of Main Wing Gear Rack Braces, and Folding Cylinder, also Diagonal Brace Universal Joint connection at Sliding Post on Standard and Road-Master Models.

All air valves.

Rollers on Slide Posts of Standard and Road-Master Models.

Crosshead Guide and Guide Beam of Bank Sloper Cylinder on Type A Models.

Trucks to be lubricated in accordance with the standard practiced by the railroad. Friction side bearings and truck center castings should be kept well greased at all times. Late Type A Models have a lubricating plug on front deck to reach the truck side bearings.

At the end of each days work be sure to drain all water from the main reservoir.

When car is to idle for a considerable period of time be sure all exposed piston rods of operating cylinders are coated with a neutral grease.

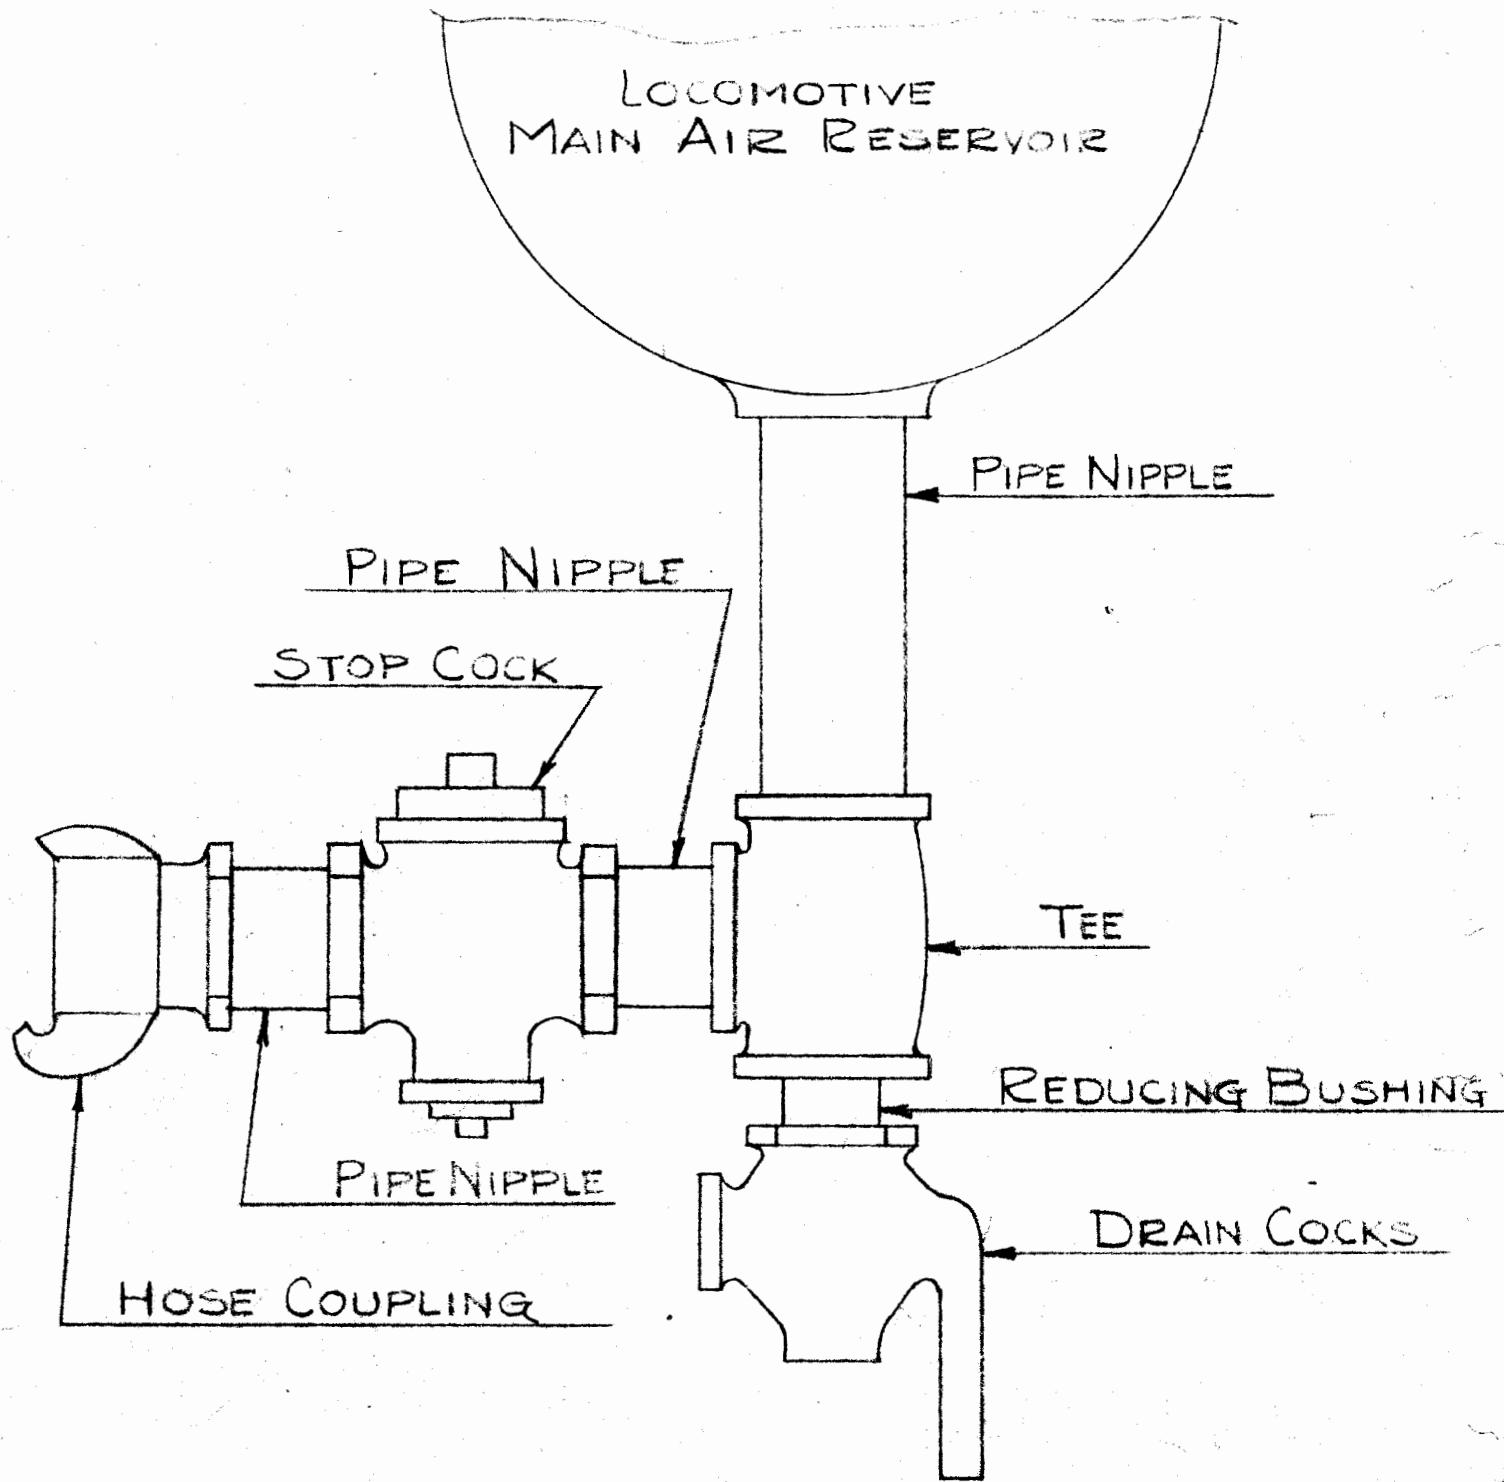

#### WINTER LUBRICATION

Where temperatures below freezing are expected, pour 1 pint of alcohol in each manifold lubricating plug, before turning air into the car from the locomotive. Allow a few minutes for alcohol to flow into the main reservoir. Alcohol fumes will prevent frost forming in air lines and cylinders. Follow with a very light grade of engine lubricating oil, preferably S.A.E. #10 and lubricate valves and cylinders as noted in second paragraph.

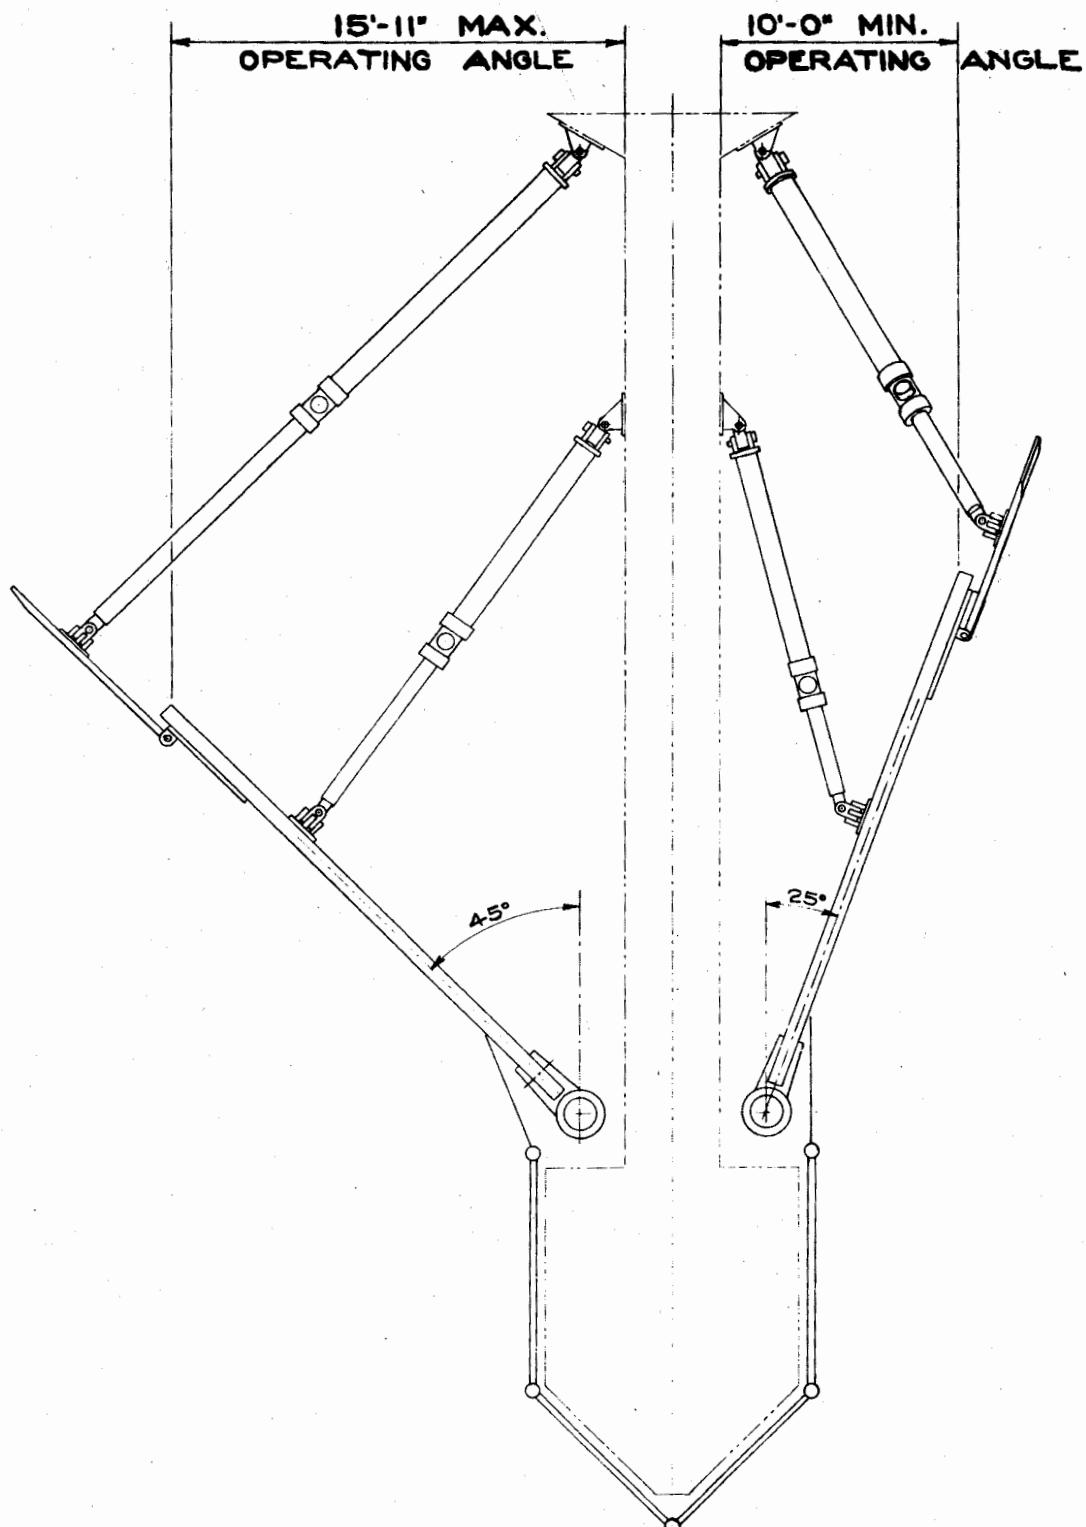

Alcohol will not effect packing or packing cups in the cylinder if a lubricating agent is used.

## **WHEN OPERATING BANK SLOPER WINGS**

**DON'T -** LOCK THE WING BRACES WHEN BANK SLOPER WING IS IN THE UP POSITION, IF BANK SLOPER IS TO BE LOWERED BECAUSE THE WING BRACE PUSHES THE BANK SLOPER OUTWARD AND DAMAGE TO THE HINGE MAY OCCUR.

**DO -** LOCK THE WING BRACES AFTER THE BANK SLOPER WING IS POSITIONED FOR THE SLOPE REQUIRED. IF THIS IS IMPRACTICAL, THEN PLACE THE BANK SLOPER IN THE HALF WAY POSITION AS SHOWN IN THE SKETCH AND LOCK THE WING BRACES. NOW IF THE BANK SLOPER IS RAISED OR LOWERED THE WING DISTORTION WILL BE ONLY HALF AS MUCH AS THAT MENTIONED ABOVE.

# OPERATING INSTRUCTIONS

FOR  
TYPE A JORDAN SPREADER-DITCHER  
WITH  
GEAR TYPE TELESCOPIC BRACES

#### PROCEDURE -

Connect air line to air reservoir on Spreader-Ditcher.

See that all operating valve handles are in neutral position.

Remove all safety rods and chains.

#### TO OPERATE FRONT PLOW -

Move valve handle **A** to "up" position.

Step on foot pedal **H** to release lock.

Remove adjustment pins and insert in holes for desired flanging depth.

To lower plow, move valve handle **A** to "down" position.

When crosshead reaches adjustment pins, move valve handle **A** to neutral position.

To raise plow, reverse operation.

#### TO OPEN SPREADER-DITCHER WINGS -

Move valve handle **B** to "up" position.

Remove adjustment pins from under crosshead and re-set pins in holes for desired depth of cut.

Step on foot pedal valve **I** and **J** and move valve handle **C** to "up" position.

Move valve handle **D** slowly to "out" position when desired wing operating angle is reached, slightly reverse valve **D** to cushion air in cylinder then return to neutral position.

Move valve handle **C** to "down" position when desired wing slope is reached, remove foot from foot pedal **I** thus locking diagonal brace.

#### TO SET BANK SLOPER WING -

Step on foot pedals **J** and **K**, move valve handle **E** to "down" position and release foot pedal **K** when bank sloper wing reaches 45° position, return valve handle **E** to neutral position.

#### MAIN WINGS -

Move valve handle **B** to "down" position, lowering main wing approximately 8", then release foot pedal **J** which locks wing braces.

Main wing can now be raised and lowered also bank sloper wing set at various operating slopes.

#### TO OPERATE SLIDING DITCH SECTION -

Move valve handle **G** to lower and raise ditch section.

When not in operation, always raise ditch section.

#### TO CLOSE SPREADER-DITCHER WINGS - Reverse above operations.

#### CARRIER WING FORM -

With main wing closed, disconnect rear wing brace, apply brace safety chain.

Open main wing, lower bank sloper wing to level position and lock, disconnect operating cylinder.

Remove bolt holding bank sloper wing to pivot hinge and swing forward.

Remove safety chain, and by means of block and tackle remove carrier wing brace and connect to bank sloper wing.

Step on foot pedal **L** to release lock and move valve handle **F** to open and close carrier wing to desired position, leading slightly into bank.

#### GENERAL INSTRUCTIONS -

Emergency brake valve is located in same position as valve **A** in left hand manifold.

Remember main wing braces are locked at all times when foot pedals are released.

Keep all moving parts well greased except gear rack on telescopic wing braces.

To oil air cylinders, turn cutout cock **N** to cut air out of operating manifold. Remove oil plug **M**, pour in half pint of light oil, replace oil plug. Turn air into manifold, give each valve a quick turn so a small amount of oil is sprayed into each air cylinder.

Keep all bolts tight, renew cutting shoes before excessive wear occurs.

For complete operating instructions and Repair Parts List, write O. F. Jordan Co., East Chicago, Indiana, giving machine serial number.

Suggestions from operators always welcomed.

#### CAUTION

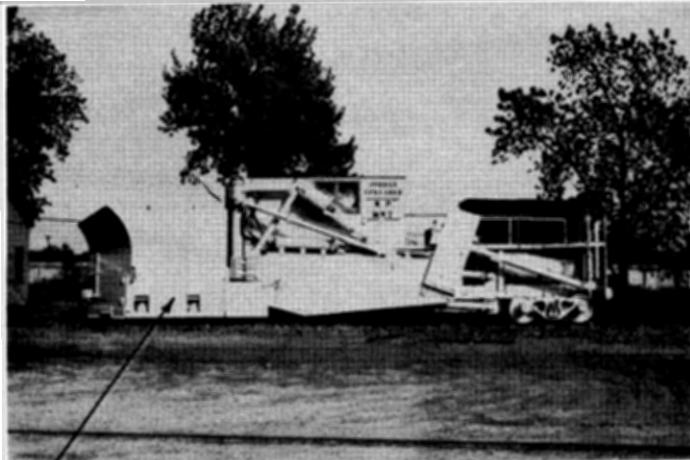

Do not operate Spreader-Ditcher wings at a lesser angle than 25° out from car body.

**O. F. JORDAN COMPANY**  
EAST CHICAGO, INDIANA

## METHOD OF SECURING MACHINE FOR TRANSIT

MODEL NO. 3-175 & 3-210 WITH SNOW PLOW EXTENSION AS SHOWN

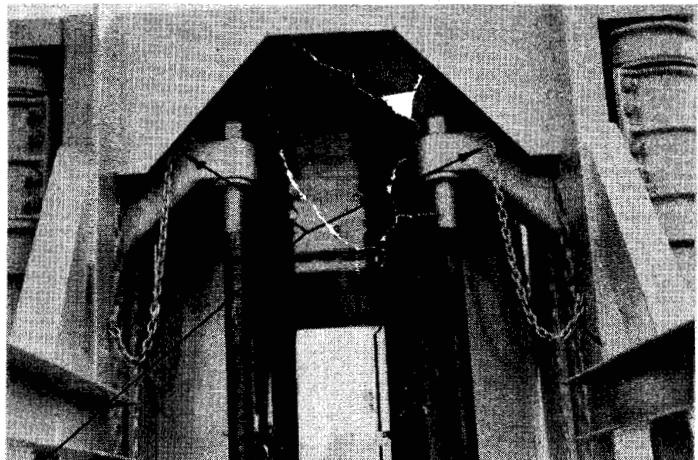

MODEL NO. 3-200 & 3-211 WITHOUT SNOW PLOW EXTENSION

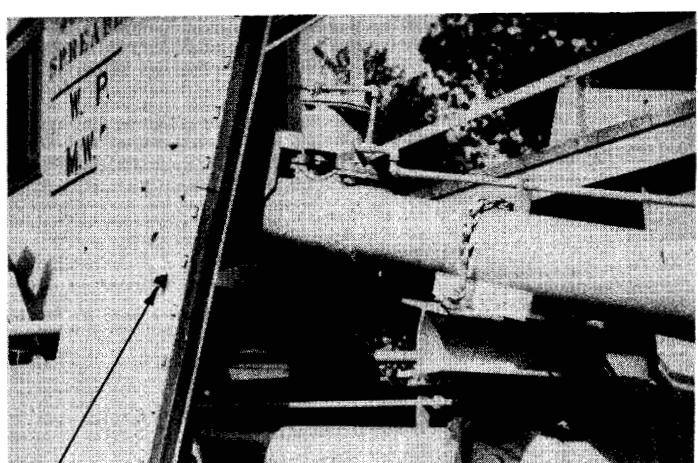

CAR SECURED FOR TRANSIT.  
JOURNAL BOX INSPECTION DOOR TO BE  
OPENED AND BOLTED TO SIDE OF PLOW.

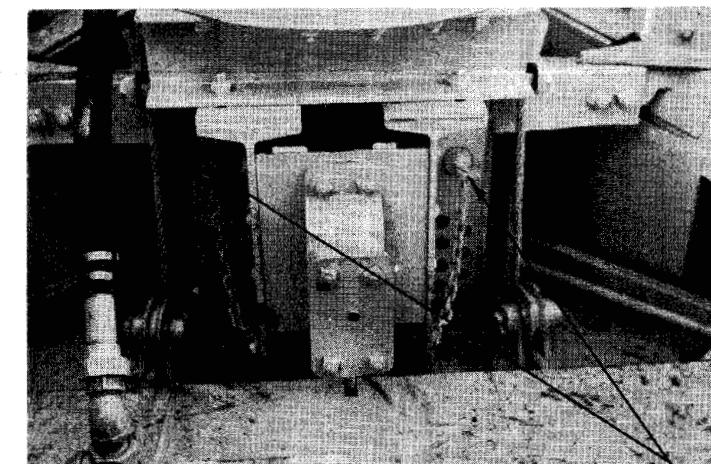

MAIN WING TO REST ON CROSSBEAM AND  
MAIN WING TO REST ON CROSSBEAM AND  
BE SECURED WITH CHAIN.

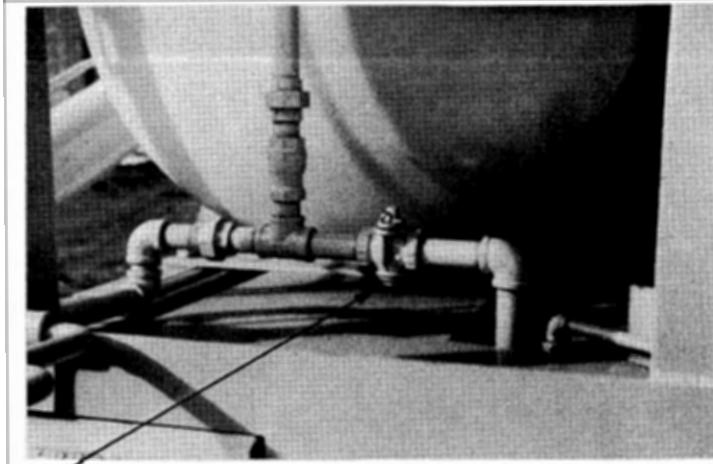

RAISE MAIN WING POSTS TO HIGHEST  
POINT, INSERT CROSSHEAD PINS.  
LOWER CROSSHEAD ON PINS.

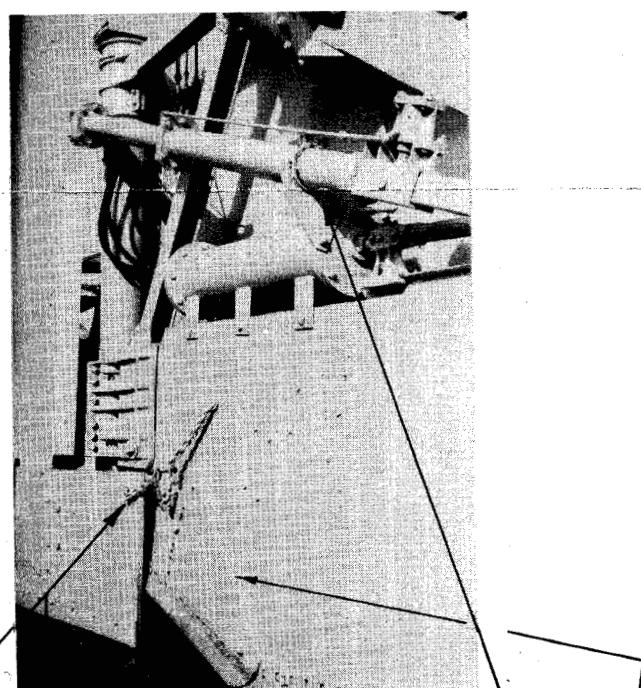

MAIN WINGS HELD TIGHT TO SIDE OF CAR  
BY TIE RODS. REAR MAIN BRACE TO BE  
CHAINED TO REAR BRACE REST.

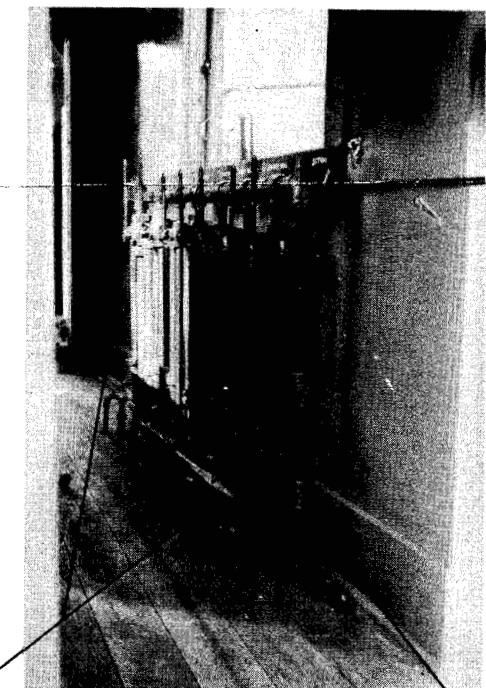

RAISE FRONT PLOW TO IT'S HIGHEST POINT,  
INSERT TWO (2) PINS IN CROSSHEAD AND  
SECURE PINS WITH COTTER KEYS.  
VALVE TO BE OPEN TO ALLOW AIR TO  
PASS THROUGH TRAIN LINE WHILE IN TRANSIT.

STOP COCK TO TRAIN LINE TO BE CLOSED  
AND MAIN RESERVOIR TO BE DRAINED.  
RESERVOIR DRAIN VALVE TO BE LEFT OPEN.

SAFETY CHAIN FOR SMALL END WING TO BE  
MADE TAUT BY GATHERING TOGETHER AND  
BOLTING LOOP CLOSED. CARRIER WING  
BRACE TO REST IN SADDLE AND BE  
SECURED WITH CHAIN. ADJUSTABLE BALLAST  
SECTION TO BE IN RAISED POSITION.

ALL UPPER VALVES AND FOOT PEDALS TO  
BE IN NEUTRAL POSITION. MANIFOLD  
CUTOUT COCK TO BE IN OFF POSITION.

# GEARED AIR MOTORS

SIZES E3G, EE3G, E9G AND EE9G (Four Cylinder)  
SIZES E53G, EE53G, E59G AND EE59G (Five Cylinder)

## Instructions and Duplicate Part List

Size E3G Geared Motor

NOTE:—When ordering Spare Parts, please give the SIZE and SERIAL NUMBER of the motor as well as the NAME and NUMBER of the part required as shown in the list.

Parts can be ordered from the nearest Branch Office or Agent.

Ingersoll-Rand Motors cannot be guaranteed if repaired with other than Ingersoll-Rand repair parts.

IF NECESSARY TO SEND A MOTOR TO THE FACTORY FOR REPAIRS INQUIRE AT OUR NEAREST BRANCH OFFICE FOR SPECIAL INSTRUCTIONS.

SEE LAST PAGE FOR ADDRESSES.

# Ingersoll-Rand

# INSTRUCTIONS

This booklet contains information that will help you receive the utmost service from your Ingersoll-Rand Geared Air Motors. Complete instructions for disassembling and assembling the Motors and a duplicate part list for ordering repair parts are contained herein. Read it carefully; then preserve it for future reference. The illustrations on pages 9 and 10 show the part number and location of each part referred to in the text.

## 1. LUBRICATION

### a. Lubricants

The recommended lubricants for the motor are as follows:

**For temperatures 30°F. to 80°F.**, use Ingersoll-Rand Medium Oil No. 50 or S.A.E. 20 or 20W Motor Oil.

**For temperatures above 80°F.**, use S.A.E. 30 Motor Oil.

**For temperatures below 30°F.**, use S.A.E. 10 or 10W Motor Oil.

The recommended lubricants for the gearing are as follows:

**For temperatures above 40°F.**, use Ingersoll-Rand Heavy Gear Grease No. 70 or a good soda base grease of No. 2 consistency.

**For temperatures below 40°F.**, use Ingersoll-Rand Medium Gear Grease No. 75 or a good soda base grease of No. 1 Consistency.

### b. Oil Level

Check the oil level daily as follows:

**When the Motor is not subjected to freezing temperatures.** After the Motor has been idle for several hours or overnight, open the Oil Cock (part 308), located at the bottom of the Motor Case (part 501), and allow the accumulated water to drain out. Close the Oil Cock at the bottom and open the one on the side of the Motor Case. Remove the Vent Cap (part 303) and pour a sufficient quantity of the recommended lubricant (paragraph 1-a) into the vent, to bring the level of oil up to the open Oil Cock. Close the upper Oil Cock.

**When the Motor is subjected to freezing temperatures.** Allow the Motor to remain idle long enough for the water content of the Motor Case to separate from the oil, but not long enough for it to freeze. Drain the water and replenish the oil as in the preceding paragraph. Should this procedure be impractical, drain the entire contents of the Motor Case immediately after operation

ceases, and refill it before resuming operation. If the Motor Case is not drained, a sufficient quantity of water will eventually accumulate so that the Oil Splasher (part 540) which is attached to the Crank (part 516) will freeze fast.

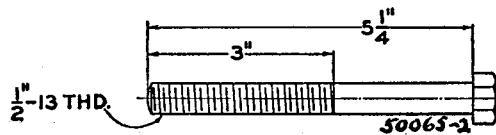

## 2. AIR SUPPLY

Keep the air line as free from dirt and moisture as possible. Blow all accumulated moisture out of the air line before starting the Motor.

We recommend the use of an air strainer as near the Motor as possible, to prevent dirt and scale from reaching the Motor.

## 3. VALVE CHEST

The Valve Chest (part 545) should be removed from the Motor Case (part 501) only if replacement of either the Valve Chest or the Rotary Valve Bushing (part 525) is necessary. To remove the Valve Chest from the Motor Case, the use of Jack Bolts is recommended. Jack Bolts can be purchased from Ingersoll-Rand (see Maintenance Tool No. 932 on page 14) or can be made according to the dimensions shown in the following illustration.

Valve Chest Jack Bolts

### a. Removal

Using a suitable wrench, unscrew and remove the four Valve Chest Screws (part 548 and 549) and Washers (part 321) from the Valve Chest (part 545). Lift the Valve Chest Cover (part 546) from the Valve Chest.

Screw a bolt,  $\frac{3}{4}$ "-10 thread on the four cylinder Motors;  $\frac{7}{8}$ "-9 thread on the five cylinder Motors, into the tapped hole in the end of the Rotary Valve (part 526) and pull it from the Rotary Valve Bushing (part 525).

Screw a No. 932 Valve Chest Jack Bolt into the tapped hole in the lug, located on each side of the Valve Chest, until it contacts the Motor Case (part 501). Turn each Jack Bolt, a little at a time, until the Rotary Valve Bushing is withdrawn from the Motor Case.

### b. Disassembly

**Caution:**—The Rotary Valve Bushing must be pressed from the Valve Chest exactly as directed. Pressing it out of the Cover side

of the Chest, or using an arbor that will not clean the Bushing Key (part 538) that protrudes from the wall of the Chest into the slot in the Bushing, will result in the Key being sheared off.

Support the face of the Chest that contacts the Motor Case and, using an arbor that will clear the Bushing Key, press the Bushing from the Chest.

c. **Assembly**

Support the face of the Valve Chest (part 545) that contacts the Valve Chest Cover (part 546). Align the keyway in the Rotary Valve Bushing (part 525) with the Bushing Key (part 538) that protrudes into the bore of the Chest. Using a suitable arbor, press the Bushing into the Chest until it is flush with the supported face of the Chest.

d. **Installation**

Start the protruding end of the Rotary Valve Bushing (part 525), squarely into the bore in the Motor Case (part 501), aligning the bolt holes in the Chest with the tapped holes in the Motor Case. Place a wood block on the faces of the Valve Chest and the Rotary Valve Bushing. Being sure to maintain the alignment, and keeping the Bushing square in the bore, drive in the Bushing until the Valve Chest contacts the Motor Case face.

Check the fit of the Rotary Valve (part 526) in the Rotary Valve Bushing (part 525).

**Note:**—Rotary Valve Bushings furnished as repair parts are accurately sized at the factory and if carefully installed, reaming or lapping is seldom necessary to obtain a good running fit between the Rotary Valve and Bushing. However, if the Bushing does "close-in" slightly when it is pressed into the Valve Chest and Motor Case, it will be necessary to either ream the Bushing to size or lap the Valve into the Bushing to obtain the necessary fit.

If reaming or lapping is necessary, completely disassemble the motor (paragraph 4-a and b.)

For Sizes E3G, EE3G, E9G and EE9G, ream the Rotary Valve Bushing 1.625" diameter.

For Sizes E53G, EE53G, E59G and EE59G, ream the Rotary Valve Bushing 1.875" diameter.

**Caution:**—Remove all chips after reaming. When lapping the Valve in the Bushing, use a mild, fine-grained compound whose abrasive agent will break up rapidly.

**Caution:**—After lapping, wash the parts thoroughly in kerosene or other solvent to

remove all trace of the compound.

On Sizes E3G, EE3G, E9G and EE9G Motors, a single Valve Drive Pin (part 527) is located in the front end (hub end) of the Rotary Valve. On Sizes E53G, EE53G, E59G and EE59G, there are two Valve Drive Pins, Small (part 627) in addition to the No. 527 Valve Drive Pin, Large. Align the Valve Drive Pin (or Pins) with the drive hole (or holes) in the Crank (part 516) and insert the Valve into the Bushing.

Place the Valve Chest Cover (part 546) on the Valve Chest, aligning the holes in the Cover with those in the Chest. Using a suitable wrench, screw the two Valve Chest Screws, Long (part 548) into the two bottom holes in the Chest. Screw the two Valve Chest Screws, Short (part 549) into the two remaining holes in the Valve Chest. Use a Lock Washer (part 321) with each Valve Chest Screw.

## 4. MOTOR

a. **Removal**

Open the Oil Cock (part 308), located at the bottom of the Motor Case (part 501), and drain all the oil from the Motor Case.

Unscrew and remove the eight Motor Case Screws (part 312) from the Motor Case and lift the Motor Complete (part A501) from the Gear Box (part 750).

b. **Disassembly**

Unscrew and remove the four Cylinder Cap Screws (part 506) and Washers (part 504) from one of the Cylinders (part 505). Pull the Cylinder from the Motor Case (part 501). Rotate the Crank until the Piston exposed is at top dead center. Push the Piston Wrist Pin (part 514) out of the Piston and lift the Piston off the Connecting Rod (part 509). Repeat this process on each Cylinder until all Cylinders and Pistons are removed.

With all the Pistons removed, only the fit of the Crank Bearing (part 518) retains the Crank assembly in the Motor Case. In most instances the Crank assembly can be removed by pulling on it while tapping the face of the Motor Case, lightly, with a soft hammer. Should this method fail to loosen the Bearing remove the Rotary Valve (part 525) from the Valve Chest (part 545) (paragraph 3-b), and insert a brass rod or hard-wood arbor through the bore of the Rotary Valve Bushing (part 525) and against the end of the Crank. Drive on the rod until the Crank assembly is loose. Tilt the Crank assembly and lift it from the Motor Case.

Loosen the Crank Pinch Bolt (part 521), straighten the split end of the Crank Taper Pin (part 520) and drive it out of the Crank (part 516). Separate the two sections of the Crank and remove the Connecting Rod Rings (part 510), Connecting Rods (part 509), Connecting Rod Bushing (part 511) and Crank Pin Sleeve (part 519), from the Crank.

Only if replacement is necessary, pry the Crank Bearing (part 518) from each section of the Crank.

c. **Assembly**

**Note:**—The two sections of the Crank (part 516) are matched before final machining, and the web of each section is stamped with an identification mark such as AA17, CC21, XX19, etc. Only sections bearing identical markings can be used together. If two or more Cranks are disassembled at one time, check the web of each section before reassembling and make sure that only matched parts are used together.

Slide the Crank Pin Sleeve (part 519), plain end first (there is a tang on one end), over the Crank pin. Slide the Connecting Rod Bushing (part 511) over the Sleeve. Place one of the Connecting Rod Rings (part 510) radius end last, over the Bushing.

Place the Connecting Rods (part 509) around the Bushing, entering the foot on each Rod into the space between the Bushing and the Ring. Slide the other Connecting Rod Ring, radius end first, over the feet on the Rods.

Join the two sections of the Crank, so that the tang on the Crank Pin Sleeve enters the slot in the Crank web, and the holes for the Crank Taper Pin are aligned.

Drive the Crank Taper Pin (part 520) into the aligned holes in the two sections of the Crank. Then tighten the Crank Pinch Bolt (part 521) and spread the split end of the Pin.

Using a sleeve that will contact only the inner ring of the Bearing, press a Crank Bearing (part 518) onto each end of the Crank until it seats against the shoulder.

Install the Crank assembly in the Motor Case, seating the Crank Bearing in the recess in the Case.

Rotate the Crank until one Connecting Rod (part 509) is at top dead center. Place a Piston (part 513) on this Connecting Rod and retain it by installing the Piston Wrist Pin (part 514). Place a Cylinder Gasket (part 507) over the small diameter and

against the flange on the Cylinder (part 505). Slide the Cylinder over the Piston and into the Motor Case.

**Note:**—The Piston Ring (part 337) (compression ring near the top of the Piston) can be compressed sufficiently with the fingers to enter it into the Cylinder. It is also possible to start the Oil Regulating Ring (part 338) with the fingers, but it is very difficult and there is danger of breaking the Ring if it is not uniformly started into the Cylinder. It is recommended that a Piston Ring Compressor be used. One can be purchased from Ingersoll-Rand (See maintenance Tool No. 933 on page 14) or one can be made from  $\frac{1}{16}$ " spring steel, about  $\frac{3}{4}$ " wide, bent into circular shape of such size that it can be slipped over the Piston to hold the Ring compressed into its groove.

Retain the Cylinder on the Motor Case with four Cylinder Cap Screws (part 506) and Washers (part 504) (copper washer). Repeat this process until all the Cylinders are installed.

d. **Installation**

Place the Motor Case Gasket (part 592) on the face of the Motor Case. Enter the spline on the Motor Pinion (part 752) into the spline-broached section of the Crank and slide the Gear Box (part 750) and the Motor Case together. Retain with the eight Motor Case Screws (part 312) and Lock Washers (part 321).

5. **GEAR BOX**

a. **Removal**

Remove the Motor Complete (part A501) from the Gear Box (part 750) (paragraph 4-a).

b. **Disassembly**

Unscrew the Drain Plug (part 351) and drain the grease from the Gear Box (part 750).

Screw a  $\frac{3}{8}$ "-16 thread cap screw into each of the two tapped holes, located on the bolt circle of the Motor Case Cover (part 751) and, using them as jack bolts, remove the Motor Case Cover from the Gear Box.

On Sizes E3G, EE3G, E53G and EE53G, tap the end of the Drive Shaft (part 757) with a soft hammer to drive this assembly from the Gear Box.

On Sizes E9G, EE9G, E59G and EE59G, pry the Intermediate Gear (part 364), Drive Gear (part 756) and their assembled parts, out of the Gear Box. Both Gears should be removed simultaneously.

**On all Sizes**, tap the Gear Box with a soft hammer while pulling on the Motor Pinion (part 752) to remove the Pinion and Motor Pinion Bearing (part 754) from the Gear Box.

Remove the Drive Shaft Packing (part 759) from the Bearing recess in the Gear Box. Inspect the Packing for wear or damage. If it is not serviceable, replace it with a new part during assembly.

Inspect the Motor Pinion Bearing for wear or damage. The Bearing should be removed from the Motor Pinion only if replacement of either the Bearing or Pinion is required. If the Bearing is damaged or worn, clamp its outer ring in a vise and, using a suitable rod or punch, drive the Motor Pinion from the Bearing.

If the Motor Pinion is to be replaced, it is recommended that a new Bearing also be installed.

Unscrew and remove the Bearing Screw (part 769) from the end of the Drive Shaft (part 757). On Sizes E9G, EE9G, E59G and EE59G, loosen the Drive Gear Set Screw (part 52) which is located in the Drive Gear hub.

Place the Drive Shaft assembly on the table of an arbor press, supporting it by the Drive Gear so that the externally threaded end of the Shaft is down. Using a suitable arbor placed against the internally threaded end of the Shaft, press the Shaft from the Drive Gear Inner Bearing (part 762) and the Drive Gear. Remove the Drive Gear Key (part 758) from the Drive Shaft.

**On Sizes E3G, EE3G, E53G, and EE53G.**  
Slide the Drive Shaft Bearing Spacer (part 761) and Oil Washer (part 770) from the Drive Shaft. Stand a sleeve, 1.625" inside diameter and 4½" long, on the table of an arbor press. Insert the externally threaded end of the Drive Shaft into the sleeve. Press on the internally threaded end of the Drive Shaft until the Bearing is loose on the Shaft. Slide the Bearing and the Drive Shaft Packing Washer (part 780) from the Drive Shaft.

**On Sizes E9G, EE9G, E59G and EE59G.**  
Slide the Oil Washer (part 770) from the Drive Shaft. Stand a sleeve, 1.875" inside diameter and 4½" long, on the table of an arbor press. Insert the externally threaded end of the Drive Shaft into the sleeve. Press on the internally threaded end of the Drive Shaft until the Bearing is loose on the Shaft.

Slide the Bearing and Drive Shaft Packing Washer (part 780) from the Drive Shaft. Unscrew and remove the Bearing Screw (part 769) from the Intermediate Shaft (part 365). Stand a sleeve, 1 13/16" inside diameter and 6" long, on the table of an arbor press. Stand the Intermediate Gear assembly on the sleeve, with the inner ring of the Intermediate Gear Outer Bearing (part 367) contacting the sleeve. Using a 7/8" arbor against the internally threaded end of the Intermediate Shaft, press the Intermediate Shaft out of the Intermediate Gear Inner Bearing (part 366), Bearing Liner (part 35), Intermediate Gear (part 364), Intermediate Gear Spacer (part 369) and the Intermediate Gear Outer Bearing.

**On all Sizes** wash all parts in kerosene or other petroleum solvent, removing all old grease to enable a thorough inspection of parts for cracks or burrs. Inspect all Bearings for wear or damage, and all Gears for chipped or worn teeth. Replace worn or damaged parts with new parts before proceeding with assembly.

#### c. Assembly

The Drive Shaft Packing (part 759) rides on the surface of the largest diameter on the Drive Shaft (part 757). Inspect this surface for rough spots. Smooth any nicks or burrs with an oil stone. Wash the Shaft thoroughly after stoning.

Stand a sleeve, 1 5/8" inside diameter and 7" long, on the table of an arbor press. Place the Drive Shaft Outer Bearing (part 763), shield side up, on the sleeve, with the inner ring of the Bearing contacting the sleeve. Slide the Drive Shaft Packing Washer (part 780) over the internally threaded end of the Drive Shaft and against the flange. Insert the internally threaded end of the Drive Shaft through the Bearing bore. Slide a piece of ¾" pipe, 1 ¼" long, over the externally threaded end of the Shaft and press the Shaft into the Bearing until the Bearing, the Packing Washer and the flange on the Shaft are in firm contact.

**On Sizes E3G, EE3G, E53G and EE53G.**  
Slip the Oil Washer (part 770), followed by the Drive Shaft Bearing Spacer (part 761) over the internally threaded end of the Drive Shaft. Install the Drive Gear Key (part 758) in the keyway in the Drive Shaft. Place the Drive Gear (part 756), short hub down, on the sleeve. Align the Key in the Shaft with the keyway in the Gear. Slide a piece of

$\frac{3}{4}$ " pipe,  $1\frac{1}{4}$ " long, over the externally threaded end of the Shaft and press the Shaft into the Gear until the Bearing, the Oil Washer, the Spacer and the Gear are in firm contact. **Note:**—Occasionally, because of existing tolerances, the Gear may not be a tight press.

**Note:**—At one time the Drive Shaft Inner Bearing (part 762) was a radial-thrust type ball bearing on which the outer ring on one side is marked "Thrust Here". When reassembling a Drive Shaft unit inspect the Inner Bearing and, if so marked, install it **unmarked side first** on the Shaft. Unless the Bearing is marked it can be installed either side first. Replacement Bearings furnished by Ingersoll-Rand will not be the radial-thrust type.

Support the inner ring of the Drive Shaft Inner Bearing (part 762) and press the internally threaded end of the Drive Shaft into the Bearing until the Gear hub contacts the inner ring. Using a suitable wrench, run the Bearing Screw (part 769) firmly into the tapped end of the Drive Shaft. Enter a punch into the hole in the Screw head and strike it a sharp blow with a hammer to lock the Screw in position.

**On Sizes E9G, EE9G, E59G and EE59G.** Slip the Oil Washer (part 770) over the internally threaded end of the Drive Shaft and against the Bearing. Install the Drive Gear Key (part 758) in the keyway in the Drive Shaft. Place the Drive Gear (part 756), short hub down, on the sleeve. Insert the internally threaded end of the Drive Shaft into the Gear bore and align the Key in the Shaft with the keyway in the Gear. Slide a piece of  $\frac{3}{4}$ " pipe,  $1\frac{1}{4}$ " long, over the externally threaded end of the Shaft and press the Shaft into the Gear until the Bearing, Oil Washer and Gear are in firm contact. Securely tighten the Drive Gear Set Screw (part 52), located in the Drive Gear hub. **Note:**—Occasionally, because of existing tolerances, the Gear may not be a tight press on the Shaft.

**Note:**—At one time the Drive Shaft Inner Bearing (part 762) was a radial-thrust type ball bearing on which the outer ring on one side is marked "Thrust Here". When reassembling a Drive Shaft unit inspect the Inner Bearing and, if so marked, install it **unmarked side first** on the Shaft. Unless the Bearing is marked it can be installed either side first. Replacement Bearings furnished by Ingersoll-Rand will not be the

radial-thrust type.

Support the inner ring of the Drive Shaft Inner Bearing (part 762) and press the internally threaded end of the Drive Shaft into the Bearing until the Gear hub contacts the inner ring. Using a suitable wrench, run the Bearing Screw (part 769) firmly into the tapped end of the Drive Shaft. Enter a punch into the hole in the Screw head and strike it a sharp blow with a hammer to lock the Screw in position.

Stand a sleeve,  $1\frac{7}{16}$ " inside diameter and 5" long on the table of an arbor press. Place the Intermediate Gear Outer Bearing (part 367), either side up, on the sleeve with the inner ring contacting the sleeve. Insert the small end of the Intermediate Shaft (part 365) through the Bearing bore and press on the large end of the Shaft until the flange seats on the inner ring of the Bearing. Remove the assembled Shaft and Bearing from the sleeve.

Place the Intermediate Gear (part 364), small diameter up, on the sleeve. Slip the Intermediate Gear Spacer (part 369) over the small end of the Intermediate Shaft and insert the Shaft into the Gear. Press the Shaft into the Gear until the Bearing, Spacer and Gear are in firm contact. Place the assembly on the press table, standing it upright on the large end of the Shaft. Start the Bearing Liner (part 35) squarely onto the small end of the Shaft and press it on until it seats against the shoulder. Start the Intermediate Gear Inner Bearing (part 366) squarely onto the Bearing Liner. Using an arbor that will contact only the inner ring, press the Bearing over the Liner until the inner ring of the Bearing contacts the face of the Intermediate Gear hub.

Using a suitable wrench, run the Bearing Screw (part 769) firmly into the tapped end of the Intermediate Shaft. Enter a small punch into the hole in the Screw head and strike it a sharp blow to lock the Screw in position.

**On Sizes E3G, EE3G, E53G and EE53G.** If the Motor Pinion Bearing (part 754) was removed from the Motor Pinion (part 752), start the new Bearing, either side first, squarely into the recess in the wall of the shallow portion of the Gear Box. Using a sleeve that will contact only the outer ring drive the Bearing into the recess until it seats. Slip the Drive Shaft Packing (part 759) over the externally threaded end of the Drive Shaft (part 757) and up against

the Drive Shaft Packing Washer (part 780). Insert the externally threaded end of the Drive Shaft through the hole in the bottom of the Bearing recess, and align the Drive Shaft Outer Bearing with the Bearing recess. **Note:**—It is necessary to tilt the Drive Shaft assembly slightly toward the recess containing the Motor Pinion Bearing, in order to allow the teeth on the Drive Gear (part 756) to clear the flange on the Gear Box. Force the assembly into the Gear Box until the Drive Gear clears the flange on the Gear Box. Slip the assembly into alignment and drive it into the Gear Box until it seats. Engage the teeth on the Motor Pinion with those on the Drive Gear, entering the Pinion hub into the bore of the Motor Pinion Bearing. Using a soft hammer, drive the Pinion into the Bearing until it seats.

If the Motor Pinion Bearing was not removed from the Motor Pinion, install the Drive Shaft Packing on the Drive Shaft assembly and start the assembly into the Gear Box as explained in the preceding paragraph. Before forcing the Drive Shaft assembly past the flange on the Gear Box, engage the teeth on the Motor Pinion with those on the Drive Gear and align the Motor Pinion Bearing with the recess in the Gear Box. Install the two assemblies simultaneously, by driving on first one then the other until both are seated.

On Sizes E9G, EE9G, E59G and EE59G. If the Motor Pinion Bearing (part 754) was removed from the Motor Pinion (part 752), start the new Bearing, either side first, squarely into the recess in the wall of the shallow portion of the Gear Box. Using a sleeve that will contact only the outer ring, drive the Bearing into the recess until it seats. Slip the Drive Shaft Packing (part 759) over the externally threaded end of the Drive Shaft (part 757) and up against the Drive Shaft Packing Washer (part 780). Engage the teeth on the small diameter of the Intermediate Gear (part 364) with those on the Drive Gear (part 756). Insert the externally threaded end of the Drive Shaft into the hole in the bottom of the Drive Shaft Outer Bearing recess (part 763), and start both assemblies into the Gear Box. **Note:**—

It is necessary to tilt the assemblies slightly toward the recess containing the Motor Pinion Bearing, in order to allow the teeth on the Intermediate Gear to clear the flange on the Gear Box. Force the assemblies into the Gear Box until the Intermediate Gear clears the flange on the Gear Box. Slip the assemblies into alignment and drive them into the Gear Box until they seat.

Engage the teeth on the Motor Pinion with those on the Intermediate Gear, entering the Pinion hub into the bore of the Motor Pinion Bearing. Using a soft hammer, drive the Pinion into the Bearing until it seats.

If the Motor Pinion Bearing was not removed from the Motor Pinion, install the Drive Shaft Packing on the Drive Shaft and start the Drive Shaft and Intermediate Shaft assemblies into the Gear Box as explained in the preceding paragraphs. Before forcing the Intermediate Shaft assembly past the flange on the Gear Box, engage the teeth on the Motor Pinion with those on the Intermediate Gear. Align the Motor Pinion Bearing with the remaining recess in the Gear Box and install the three assemblies simultaneously by driving each one in a little at a time until all three are seated.

On all Sizes, inspect the Motor Pinion Packing (part 755), located in the bore of the center boss on the Motor Case Cover (part 751). If replacement is necessary, remove the damaged Packing and install a new one.

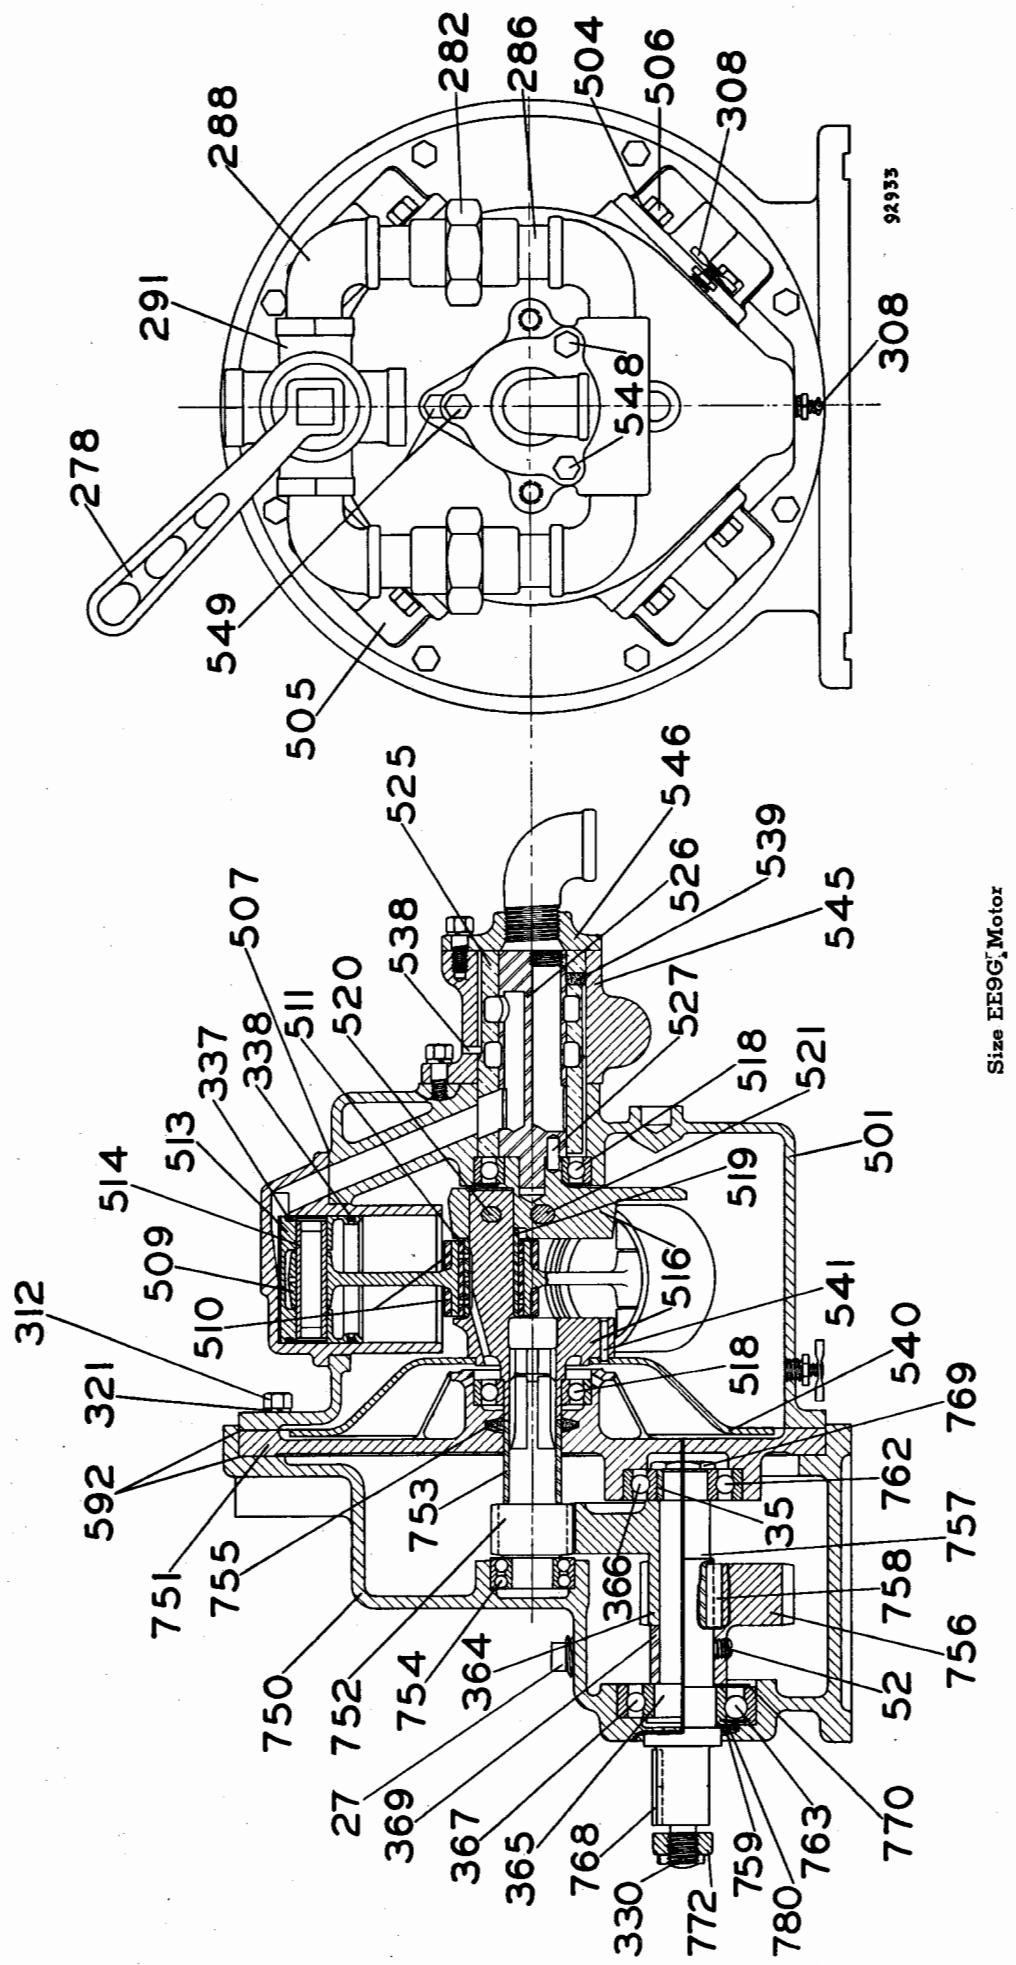

Insert the Motor Pinion Spacer (part 753), into the bore containing the Motor Pinion Packing, being careful not to damage the Packing. Allow the Spacer to extend about 1" out of the flat side of the Cover.

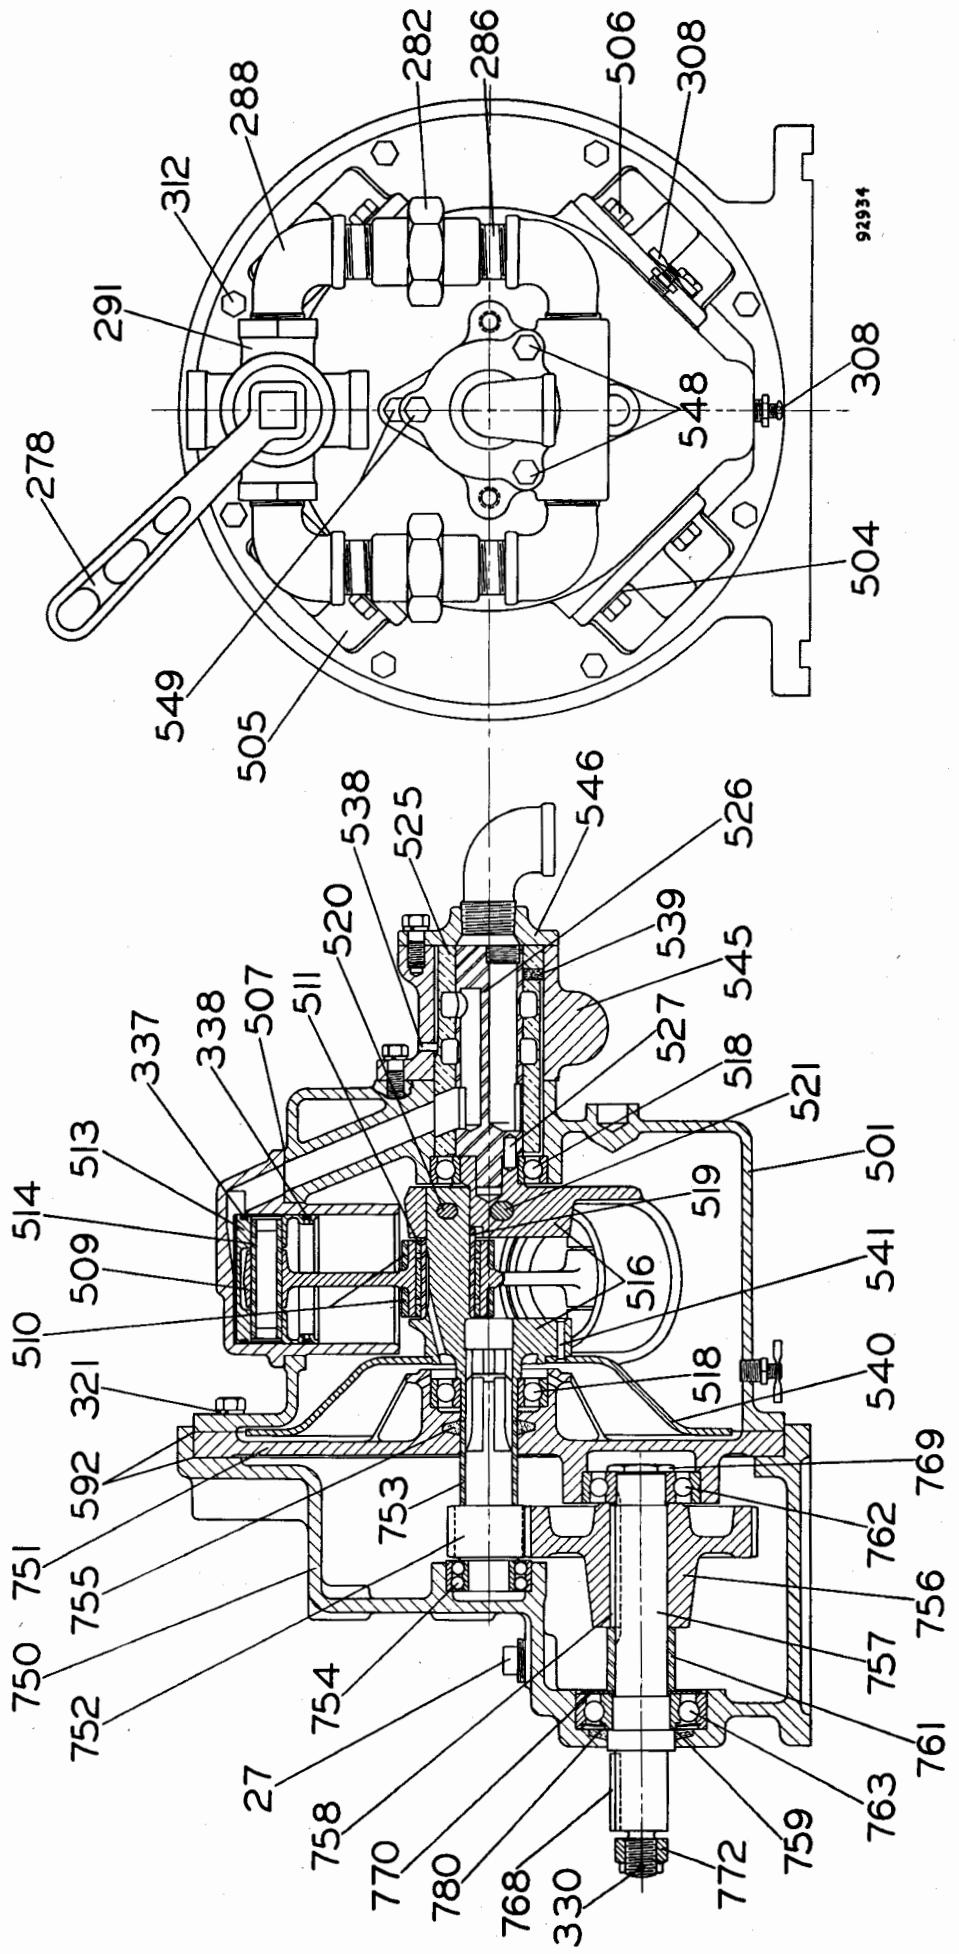

Using suitable blocking, support the Gear Box open face up and put five pounds of the recommended gear lubricant (paragraph 1-a) into it.

Place a Motor Case Cover Gasket (part 592) on the Gear Box flange and slide the Motor Case Cover (part 751) into position, tapping it with a soft hammer until it is seated.

d. Installation

Install the Motor Complete on the Gear Box (paragraph 4-d).

<sup>†</sup>When equipped with a standard Rotary Valve (part 526) the Drive Shaft on Sizes E3G and E53G Non-Reversible Motors rotates in a clockwise direction when facing the Shaft; the Shaft on the Sizes E9G and E59G Non-Reversible Motors rotates in a counterclockwise direction. The use of the special Rotary Valve (part 526R) reverses the direction of rotation.

\*Reversible Motors equipped with the standard Rotary Valve (part 526) have the same speed and power in either direction of rotation. When equipped with the special Rotary Valve (part 500), Sizes EE3G and EE53G develop greater speed and power in the clockwise direction of rotation, as viewed when facing the Drive Shaft. Sizes EE9G and EE59G develop greater speed and power in the counterclockwise direction. When equipped with the special Rotary Valve (part 503), speed and power characteristics relative to the direction of rotation are directly opposite those for the No. 500 Rotary Valve.

**UNIT ASSEMBLIES**

Part No.	Name of Part
U501	<b>Motor Assembly</b> For Sizes E3G and E9G (includes parts 283, 284, 285, 303, 308 (2), 321 (4), 337 (4), 338 (4), 402, 421, 501, 504 (16), 505 (4), 506 (16), 507 (4), 509 (4), 510 (2), 511, 513 (4), 514 (4), 516, 518 (2), 519, 520, 521, 525, 526, 527, 537, 538, 539, 540, 541 (4), 545, 546, 548 (2), 549 (2), 889, 891, 892 and 893) For Sizes E53G and E59G (includes parts 283, 285, 303, 308 (2), 321 (4), 337 (5), 338 (5), 368, 402, 421, 501, 504 (20), 505 (5), 506 (20), 507 (5), 509 (5), 510 (2), 511, 513 (5), 514 (5), 516, 518 (2), 519, 520, 521, 525, 526, 527, 537, 538, 540, 541 (4), 545, 546, 548 (2), 549 (2), 627 (2), 889, 891, 892, 893 and 947) For Sizes EE3G and EE9G (includes parts 278, 282 (2), 286 (4), 288 (5), 291, 303, 308 (2), 321 (4), 337 (4), 338 (4), 402, 421, 501, 504 (16), 505 (4), 506 (16), 507 (4), 509 (4), 511, 513 (4), 514 (4), 516, 518 (2), 519, 520, 521, 525, 526, 527, 537, 538, 540, 541 (4), 545, 546, 548 (2), 549 (2), 889, 891, 892 and 893) (If specified, either part 500 or part 503 will be furnished in place of part 526). For Sizes EE53G and EE59G (includes parts 278, 282 (2), 286 (4), 288 (5), 291, 303, 308 (2), 321 (4), 337 (5), 338 (5), 368, 402, 421, 501, 504 (20), 505 (5), 506 (20), 507 (5), 509 (5), 510 (2), 511, 513 (5), 514 (5), 516, 518 (2), 519, 520, 521, 525, 526, 527, 537, 538, 540, 541 (4), 545, 546, 548 (2), 549 (2), 627 (2), 889, 891, 892, 893 and 947) (If specified, either part 500 or part 503 will be furnished in place of part 526) <b>Motor Assembly—For Sizes E3G, E53G, E9G and E59G (same as U501, except part 526R is included in place of part 526)</b> <b>Gear Box Assembly</b> For Sizes E3G, E53G, EE3G and EE53G (includes parts 27, 312 (8), 321 (8), 330, 351 (2), 592 (2), 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 761, 762, 763, 766, 768, 770, 772 and 780) For Sizes E9G, E59G, EE9G and EE59G (includes parts 27, 35, 52, 312 (8), 321 (8), 330, 351 (2), 364, 365, 366, 367, 369, 592 (2), 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 762, 763, 766, 768, 769 (2), 770, 772 and 780)
